Interpretations:			
* Assay result should be interpreted in context to the clinical condition and associated result of the other investigation.			
* Previous treatment with corticosteroid therapy may result in lower TSH levels while thyroid hormone levels are normal.			
* Results are invalidated if the client has undergone a radionuclide scan within 7-14 days before the test.			
* Abnormal thyroid test findings often found in critically ill clients should be repeated after the critical nature of the condition is resolved.			
* The production circulation and disposal of thyroid hormones are altered throughout the stages of pregnancy.
